Customer Journey Map

A disaster management officer begins by collecting weather information such as rainfall, cloud visibility, and seasonal rainfall data. The details are entered into the Rising Waters web application. The machine learning model analyzes the data and predicts the possibility of a flood. Based on the prediction, authorities can issue early warnings, plan evacuations, and deploy emergency resources to reduce the impact of floods.

Phase of Journey	Stage 1	Stage 2	Stage 3
Actions <i>What does the customer do?</i>	- Collects weather information - Monitors rainfall and cloud conditions - Identifies flood-prone areas	- Enters rainfall and weather data - Reviews the entered information - Submits the data for prediction	- Views flood prediction result - Issues alerts if flood risk is high - Plans evacuation and resource allocation
Touchpoint <i>What part of the service do they interact with?</i>	- Weather Department Reports - Rising Waters Website - Weather Data Dashboard	- Data Entry Form - Prediction Button - Input Validation System	- Prediction Result Page - Alert Notification - Flood Risk Dashboard
Customer Thought <i>What is the customer thinking?</i>	- Is flooding likely today? - Is the weather data accurate? - Should we monitor this region closely?	- Did I enter the correct data? - Will the prediction be reliable? - Is any important information missing?	- How severe is the flood risk? - Should evacuation begin immediately? - Which regions need attention first?

Customer Feeling <i>What is the customer feeling?</i>	The officer feels alert while monitoring weather conditions and is hopeful that the system will provide accurate flood predictions.	The officer feels careful while entering weather data and is slightly concerned about obtaining reliable predictions.	The officer feels anxious while waiting for the prediction and relieved when the system provides timely and accurate flood risk information.
Process Ownership <i>Who is in the lead on this?</i>	The disaster management officer collects weather information, while the Rising Waters platform provides weather monitoring and prediction services.	The officer submits weather data, and the Rising Waters system validates and processes the information using the machine learning model.	The machine learning model analyzes the weather data, and the Rising Waters system generates the flood prediction for disaster management authorities.
Opportunities <i>How can we improve this stage?</i>	• Integrate live weather APIs • Improve dashboard visualization • Simplify weather monitoring	• Real-time input validation • Auto-fill weather information • Improve user experience	• SMS and Email alerts • Faster prediction processing • Integration with emergency response systems
